

## Welcome Note from Editor-in-Chief

It is with great pleasure that I write this editorial to welcome you to the first issue of this new International journal, "Pakistan Biomedical Journal" (PBMJ). The topics covered by the journal are certainly broad and interesting. Biomedical science is a collection of applied sciences that help us understand, research, and innovate within the \_eld of healthcare. It includes disciplines like molecular biology, clinical virology, bioinformatics, and biomedical engineering, among others. It's designed to apply the biological sciences to advance not only individual health but also the area of public health. Biomedical Research can help health professions better understand things like the human body and cell biology, making advances in our understanding of epidemics, health initiatives, and human health in the age of longer life expectancy. It aids our understanding of infectious disease and provides research opportunities into some of our most troubling health issues.

The journal will continue to publish high quality clinical and biomedical research in health and disease later in life. Peer review will remain a vital component of our assessment of submitted articles. I am very happy to have a team of excellent editors and editorial board members from the top international league covering in depth the related topics. They will ensure the highest standards of quality for the published manuscripts and, at the same time, keep the process time as short as possible. We hope to bring best researches in the \_eld of biomedical sciences that may serve as a guideline in health awareness, understanding the mechanisms and its management in future.

We definitely look forward to receiving your excellent studies to making PBMJ synonymous with high quality in the biomedical science domain.
